BOOTCAMP DATA

Introduction

Brands spend a growing share of their marketing budget on TikTok creators, and most of them choose those creators on gut feeling: a big follower count, a viral video someone shared in a meeting. Your agency sells the opposite promise — choosing creators on evidence. It is time to show what that evidence looks like.

Your role

Context

You are a Junior Data Analyst at a Paris-based influencer marketing agency. A client, a consumer brand preparing its next TikTok campaign, wants to understand what makes content perform on the platform before choosing which creators to work with. Your manager does not code and lives in Excel. They will open your workbook between two meetings and, if it is convincing, send a version of it to the client.

Objective

Identify what separates the best-performing TikTok content and creators from the rest, and hand your manager a workbook that makes those success factors obvious within a few minutes of reading.

Logistics

Item	Detail
Group	Solo
Duration	2 days
Tool	Microsoft Excel
Data	Five CSV extracts (see Resources)

Expectations

The data

The agency's scraper collected five raw extracts from the public side of the platform in 2021, and the agency has no more recent crawl: trending videos, the authors behind trending content, videos liked by

the platform's official account, the videos of that official account, and videos published under a humorous hashtag. They were collected at different times, with different columns and different levels of detail. The scraper only sees what the platform chooses to surface as popular.

"Success" is not defined anywhere in the data. Deciding what it means — and defending that choice — is part of the work. So is deciding which extracts are useful for the question, and which are not.

What the analysis must establish

Every success factor you put forward must be backed by a quantified relationship in the data, not by a visual impression, and the figure must appear next to the conclusion it supports. Your manager's first objection to any factor will be that the biggest accounts would win anyway: say what the data allows you to answer to that, and what it does not. The client can only act on what a creator decides, so separate what creators control from what is a consequence of their success. A factor you tested and found to have little or no influence is a result, and it belongs in the workbook as much as one that works.

Your conclusions must also say what this data cannot tell the client, given how and when it was collected.

The client also wants to know who stands out. Group the content or creators into categories that make sense for a brand choosing partners, and show which ones lead each category and why.

The client explicitly asked for a **TreeMap chart** summarising the creators or content you analysed. Tile size must carry a value and tile colour a category, each telling the reader something different.

Sharing the workbook

The client wants to know which creators to contact. The extracts also contain identifiers, nicknames, profile descriptions, links and flags describing real people, and the agency has no reason to hand all of it to a third party. Deciding what the version sent to the client contains is your call, and you must be able to defend it, including why the agency may hold this data at all. You deliver only that client version. Whatever you decide to keep out of that version must not be recoverable from the file itself in any way, including from hidden sheets or elements.

The delivered workbook must be self-contained: it opens and works on your manager's computer without macros, add-ins or links to other files.

Walkthrough

At the end of the Rush you present your workbook to your manager (played by a staff member) in a **5-minute walkthrough**, followed by a few questions. There are no slides: the workbook is the support.

A workbook that reproduces the data with charts on top, without stating conclusions, does not meet the objective. The data may stay in the workbook, but your manager asked for answers, not for a dashboard to explore.

Deliverables

Deliverable	Content
Excel workbook (.xlsx)	Single file, in the version you would send to the client: prepared data, pivot tables, charts, TreeMap, conclusions
Walkthrough	5 minutes on the workbook, followed by questions

The workbook must open on a sheet that lets a reader find the key conclusions, and the figures behind them, without scrolling through the data. Push it to your repository.

Resources

The five extracts are available in the student resources of the module (`rush-1/`).
